

What exactly is 'COVID-19'?

COVID-19 has turned the world upside down since late 2019.

A disease that was admitted from the beginning [by the WHO](#) as not being a serious threat to most people:

Most people infected with the virus will experience mild to moderate respiratory illness and recover without requiring special treatment.

It was acknowledged from the beginning that this was likely to be a self-limiting disease for most people, just like any common cold, cough or flu we've experienced all our lives.

Some people might have been more at risk, the aged or those with underlying medical conditions, but that has always been the case with respiratory ailments.

This disease it was known wasn't a serious threat to most people, was used to manipulate billions of people into submitting to repeated 'COVID-19' vaccination, along with restrictions, lockdowns, testing, masking/muzzling, quarantine, and surveillance/vaccine passports being imposed.

Billions of people went along with this gigantic scam... Particularly the medical profession who generally didn't ask any questions.

It's amazing, the power of propaganda...

So what exactly is 'COVID-19'?

Apparently it's a highly contagious disease caused by severe acute respiratory coronavirus 2 (SARS-CoV-2).

It's reputed to spread from person to person by respiratory droplets or small airborne particles when an infected person coughs, sneezes, or talks, and is in close contact

with others. I'm not sure about the evidence supporting this claim.

The [Australian Government Department of Health and Aged Care website](#) says:

The symptoms of COVID-19 can range from mild to severe. Some people recover easily while others get very sick. If you have COVID-19 you can experience:

- *fever*
- *coughing*
- *sore throat*
- *shortness of breath*

The symptoms of COVID-19 are - fever, coughing, sore throat, and shortness of breath.

Four very common respiratory symptoms.

How do four very common respiratory symptoms become associated with a virus called SARS-CoV-2, *and then become designated as a unique disease called 'COVID-19'?*

Serious question.

[Why was there a specific 'vaccine solution'](#) for this group of common respiratory symptoms called 'COVID-19' purportedly caused by SARS-CoV-2?

And why was the vaccine called a 'COVID-19' vaccine and not a SARS-CoV-2 vaccine? I asked this question in a BMJ rapid response in September 2020, but I'm not aware of any explanation, see: [Re: Covid-19 vaccines...or SARS-CoV-2 vaccines? Clarification needed.](#)

Isn't it startling to realise that 'COVID-19', the disease that has been used to inflict so much damage across the world for the past five years, is just four common symptoms that aren't a serious threat to most people...?

- fever
- coughing
- sore throat
- shortness of breath...

Wow...

Why did the majority of the medical profession fail to ask questions about this disease and the vaccines, considering it was health practitioners administering the injections?

Do any of the vaccinators - doctors, nurses, pharmacists - penetrating people's bodies with the 'COVID-19' loaded needles have any clue what they're doing?

How are they obtaining voluntary informed consent for this medical intervention against what is generally a low risk, self-limiting disease for most people?

See more about 'COVID-19' on the Australian Government Department of Health and Aged Care [website](#):

About coronavirus disease 2019 (COVID-19)

Find out how we define and monitor cases of COVID-19, how you can get vaccinated, and where you can learn more about this disease.

The telling part is the authority assumed by the World Health Organization and the World Economic Forum during this time. It also continues to this day.

I think it was mass brainwashing. Governments used the trust in public health and the intense almost primal fear of infectious disease people have to convince them that a cough, sore throat, fever and shortness of breath was the emergency red alarm for the possible onset of something that could lead to death. People only heard from cough or sore throat to possible death and the connection was made and could not be undone in their minds without a tremendous effort. From their every humiliation and draconian measure could be enforced with acceptance if it meant safety, even the speedy deployment of the unsafe Covid injections. The health profession are as open to fear and manipulation as any person on the street, maybe more so because of their blind trust in their medical authorities.
